

Mini DCU

All access control decisions are made by the Mini-DCU right at the point of access, eliminating wiring all doors to a central control unit.

> A typical installation consists of: mounting the Mini-Door Control Unit using one of several mounting arrangements, installing the INTELLIKEY electronic cylinder, and connecting to a regulated DC power supply, and an electric strike or magnetic lock.

> The stand alone unit will retain information FOR UP TO 100 YEARS

The Intelligent Mini-Door Control Unit is the decision making component of the INTELLIKEY access control system. The Mini-DCU consists of a circuit board with a microprocessor and associated circuitry. This miniature computer reads access information from an Intelligent Key, compares this information with the information programmed into the Mini-DCU's memory, and determines if the key should be granted access. Each Mini-Door Control Unit operates as an independent, stand-alone unit. All access control decisions are made by the Mini-DCU right at the point of access, eliminating wiring all doors to a central control unit.

INTELLIKEY's EZ123™ software lets you specify the access control and feature information for each Mini-DCU in your system. This information is then loaded into the controller's memory using a Lock Programming Unit (LPU). If you need to change the Mini-DCU's programming, you can easily do so with a LPU or key. Existing keyholders may be authorized in the Mini-DCU during the initial programming, eliminating the need to recall and reprogram keys when new Mini-Door Control Units are added to your system. The Mini-DCU's memory will retain programming and audit trail information, even without batteries, for up to 100 years. The electronic controller is designed to work with most standard electronic lock hardware.

- Special Features:**
- Operates from a 12 Vdc regulated power supply
 - Works with a wide variety of electronic hardware
 - Audit Trail records the most recent 3000 users by key identity, date and time
 - Time zone for auto unlock by day and time
 - Automatic Unlock/Relock feature eliminates the need for issuing keys to common doors
 - Toggle feature for turning equipment on or off
 - Automatic Daylight Savings Time adjustment
 - Low battery warning
 - AREST® feature can disable unauthorized keys in high security areas
 - Unique Electronic Restricted Keyway prevents access by keys belonging to another site
